Mechanic Notes:

ARM FUNCTIONS

when the truck came into the shop the, all of the arm functions worked except for the can tip cylinder wouldnt tip the can when the arm went all the way up. The valve for the tip was stuck in the untip position. I wasn't able to get the valve to go back to center with the controls or go through this one I figured it wouldn't last long. The driver picked up 15 houses and now there is another

valve on the valve body that is shifted in one direction and stuck causing the hyd system not to work properly. I ordered a new valve body for the truck and will install it when it comes in.

tipper cylinder because it seems as though the metal is coming from the cylinder. I ran the truck in the shop the arm worked good when it went to tip the can the valve had a spot where it was hanging up so it tipped the can quickly. I told Joe what we had found and recommended we order a new valve body because after having metal stuck. I took the valve on the truck apart as far as I could and was able to get the valve broke free. After moving it I was able to see a piece of metal in the valve spool. I got the metal out of the valve and then the valve would shift properly. We didn't find any other contamination in the system. I changed the hyd filter and I also replaced the manually. I called wayne because the valve body on this unit had just been replaced 3 weeks prior for the same valve being stuck in the same directions. Wayne said to completely disassemble the original valve body to figure out why it had failed. After taking the old valve body apart I found metal inside of it causing the valve to get

Mechanic Notes:

FUEL ISSUES

I checked the tag on the fuel tank and it tested good.

I wasn't able to read the canciever with the ward computer.

I located the canciever box in the truck and rebooted it.

it still would read the ignition or capture the data. I got

a new canciever from dean. I cleared the old programming

out of it and programmed it to the new truck. I took

the unit back to the fuel island to verify that the new

canciever was working properly and that the truck was able

to get fuel.

Brake Lights Stuck On 12/29/15

I WENT TO GET THE TRUCK TO PUUL IT ,THE BATTERY POWER
WAS OFF,I TURNED THE POWER ON AND THE BRAKE LIGHTS WERE
STAYING ON. I GOT READY TO MOVE THE TRUCK AND FOUND THAT
THE SERVICE BRAKE WAS LEFT ON. I TOOK OFF THE SERVICE BRAKE
AND BROUGHT THE TRUCK IN TO THE SHOP,THEN CHECKED THE WIRING
AND THE BRAKE LIGHT SWITCH OPERATION, IT WAS ALL WORKING OK.
THE WAY THE SYSTEM IS SET UP IF THE TRUCK IS SHUT OFF WITH
THE SERVICE BRAKE ON THE BRAKE LIGHTS WILL STAY ON AFTER THE
KEY IS SHUT OFF. EVERYTHING IS OPERATING PROPERLY,NO OTHER
PROBLEMS FOUND.

Mechanic Notes:

SHOUT DOWN LIGHT

I hooked the computer up and found that there where inactive fault codes for the regen system. when there are codes in the regen system it shuts down the exhaust after treatment system down. the truck needed a regen but couldn't do one. I cleared the codes then ran the regen diagnostics to see Maybe volume on the truck needs to be turned down? :D what is a shout down light oil pressure sensor is bad, replaced sensor. unit back in service if the codes would come back. None of the codes came back so I tried running a regen to see if it was going to fail. I completed a regen and all of the regen systems passed. I parked the truck online and let Joe Pacheco know what work had been performed and that the unit was ready to be put back into service.

Mechanic Notes:

HYD LEAK

when the driver brought this truck into the shop he told me that it had a slow hyd. leak when the truck was not running. he said that when parking it overnight by the next morning there would be a good sized puddle of fluid under the truck the next morning. I looked under the truck sensor and took it to dean to be replaced. when I removed the fitting from the block for the sensor it broke off in th engine block. I had to get the broken piece out of the engine block. I got new fitting sealed the threads and then installed them. I test drove the truck to get it hot to make sure the oil pressure sensor was going to leak anymore. and the only leak I saw was the hyd. suction line, the clamps just needed to be snugged up. I let the truck sit in the shop overnight so I could see where it was leaking from. the next morning the only leak I could find was an oil leak. There was a pressure switch on the right side of the engine block that was leaking. I removed the

Mechanic Notes:

arm stops & jerks when hot

The arm wouldn't go all of the way up. I checked all of the hyd. and everything was working properly. I started looking at the wiring. I couldn't find any wiring diagrams for this unit. I had to call tcs and talk to one of their field reps. I had to go over the whole arm wiring harness arm several times to make sure it was fixed.

I found that the power wire had several breaks in it.

I put the wiring harness back together and tried to operate the arm and it still wasn't working. I went back through the harness again and found a couple of breaks in the ground side of the harness. I wrapped the harness back up and secured it back to the arm. I ran the

to get the password reset so we could hook upto the truck. Once we got the computer fixed I found that when tryngn to regen the ignition process would fail I removed the spark plugs from the muffler and cleaned them up. I reinstalled them and tried to regen again and it worked that time. it took 45 minutes to regen when REGEN ISSUES.....

This unit had the regen light on the dash but when you tried to get the unit to do a regen it would start the process but 30 seconds into the regen it would stop. I tried to hook the computer up to the unit but we could not log into mack's server. We called mack it was done it showed the dpf had zero soot in it.

Mechanic Notes:

CLAW STAYS CLOSED.....

there was a break in the wiring harness that was causing the arm not to function properly. I repaired the harness and ran the unit to make sure it worked properly.
