Customer Service Issue # 1

Issue: Electrical issues

Fix: No functions - unit has three codes - canbus error - found plug at base not connected. Left hand speed sensor - plug not connected to controller - line contactor open - repaired a bunch of wires in the contactor panel. Unit still has open line contactor circuit. Check the wiring to contactor found no power to line contactor - has broken wire in harness. Ran jumper. Unit powers up, but will not lift - other hydraulic functions work. Add hydraulic oil tested wires components repaired wires - manual decent valve is very sloppy and lift cylinder hose is leaking. No power to level up solenoid has continuity to controller. Powered solenoid up. Unit still will not lift. Hooked up hydraulic gauge lift has zero psi - telescope is 2000 psi reviewed hydraulic and electrical schematic found wiring to four valves at hydraulic block are swapped around connected correctly - all functions working from base and from platform. Upper lift/Drive and steer not working. Wiring on steer manifold incorrect re-correct - joystick for lift swing joystick not plugged into controller, Reconnected, working unit drives with right tire. Left tire is locked up, release left brake unit drives forward, switch sticks on and won't release unless foot switch is released unit needs joystick, left hand, brake assembly wire, harness, and hydraulic hoses. Installed new brake assy, joystick and lowering valve. Replaced leaking hyd hose. Found code is due to speed sensor being bad, ordered sensor. Replaced wiring harness. Installed and adjusted speed sensor on the right hand side - unit spins right hand wheel and when stopping left hand brake locks up has speed sensor errors. Neither sensor is reading on analyzer. Installed OEM sensors and adjusted - working ok.
